OVERVIEW

Title	Maintenance testing of generic cabling products
Product description	Screened channel, Class E_A, 4 connector model
Product identification	See clause 2
EC Cabling product ID	5347
Compliance statement	2021-517
Accreditation no.	DANAK-19/22059
Project no.	12125881-01
Original accreditation no.	DANAK-19J1944
Original project no.	N312480
Test object received	2 July 2021
Test period	July 2021
Client	Excel Excel House Junction Six Industrial Park Electric Avenue Birmingham, B6 7JJ United Kingdom
Contact	Neil Payne
Specification	ISO/IEC 11801-1
Results	Compliance with specifications is verified
Prepared by	Lars Bjerring
Reviewed by	Dennis Andersen

TABLE OF CONTENTS

1 Summary

A communication channel has been tested for compliance with generic cabling standards.

The purpose of the testing was to maintain certification of the channel according to the EC VERIFIED programme.

The channel for this electrical performance test was assembled and delivered to FORCE by the client.

The channel testing has been performed under laboratory conditions at the EC Cabling Group of FORCE.

This report firstly gives a detailed description of the channels under test. Then the conclusion is given followed by the test results. At last an overview of the test procedures and applied standards are given.

2 Channel components

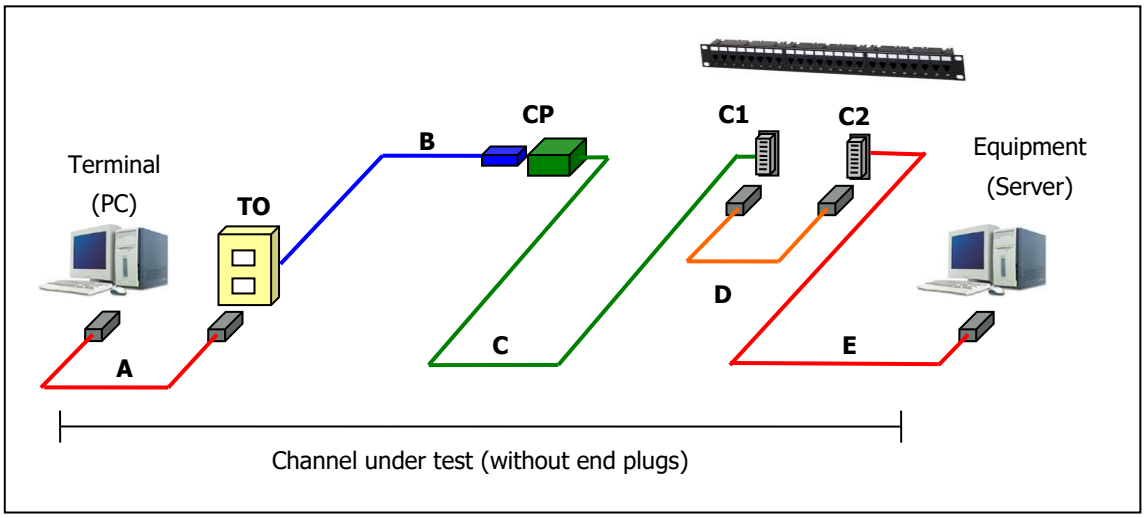

Figure 1. Channel definition (4 connector model).

The channel consists of the following components:

Item	Name	Cable type	Length	Connecting hardware
A	Terminal cord	Flexible cable	5 m	1 plug
B	Consolidation point cord	Solid cable	5 m	1 socket 1 plug
C	Horizontal cable	Horizontal cable	Channel #1: 85 m Channel #2: 15 m	2 sockets
D	Patch cord	Flexible cable	1 m	2 plugs
E	Equipment cord	Solid cable	4 m	1 socket
TO	Telecommunications Outlet / Wall Outlet			
CP	Consolidation Point connector (Sockets)			
C1, C2	Horizontal cross-connector / Floor Distributor / Patch panel			

Test samples and qualification status

Horizontal cable:
100-196 Excel Category 6A Screened F/FTP "S" Foil Cable LS0H (EC VERIFIED)

RJ45 connector for telecommunications outlet, consolidation point, and patch panel:
100-181 Excel Category 6A Low Profile Screened Keystone Jack – Toolless
(EC VERIFIED)

Terminal cord:
100-154 Excel Category 6A Screened F/FTP LS0H Patch Lead, Booted, 5m, Grey
(EC VERIFIED)

Patch cord:
100-148 Excel Category 6A Screened F/FTP LS0H Patch Lead, Booted, 1m, Grey
(EC VERIFIED)

Consolidation point cord:
100-133 Excel Category 6A Solid Core (F/FTP) screened harness/switch link leads, 5m
(jack added)

Equipment cord:
100-133 Excel Category 6A Solid Core (F/FTP) screened harness/switch link leads, 4 m (jack added)

3 Conclusion

The tested sample complies with the applied requirements.

The test results are only applicable for the tested sample.

6 Test procedures

The tests carried out on the communication cabling under test are performed according to the standard: IEC 61935-1 Specification for the testing of balanced and coaxial information technology cabling - Part 1: Installed balanced cabling as specified in ISO/IEC 11801 and related standards.

The test methods are detailed in test procedures worked out by FORCE and approved by DANAK. In this section the procedures are described briefly.

6.1 Electrical test

The electrical tests on the communication channel under test are performed according to the procedures described in this section. The performed tests are shown in the following table. The floor cable is stretched on a non-conductive surface.

Table 35. Performed tests

	Measured from	
	Equipment end (patch panel)	**Terminal end (wall outlet)**
Attenuation	x	
Near end crosstalk (NEXT)	x	x
Attenuation to crosstalk, far (ACR-F)	x	
Return loss	x	x
Propagation delay	x	
Delay skew	x	
Resistance properties	x	

6.1.1 Attenuation (Att)

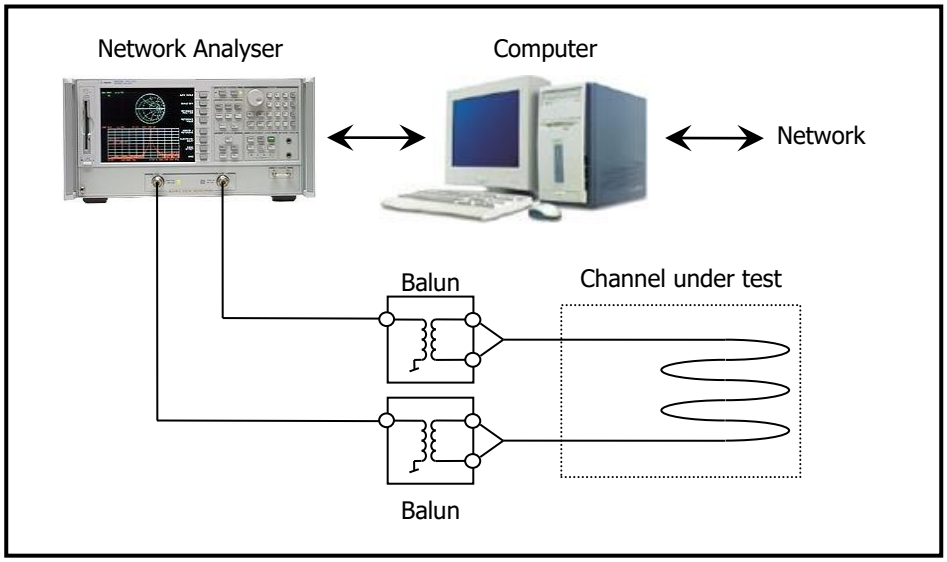

Figure 3. Test set-up for attenuation measurements.

Terminal end and equipment end are connected to one balun each.

The measurement uncertainty for Attenuation is dependant of the level of measured Attenuation. The uncertainty is shown in the table below:

Measured attenuation	Uncertainty
1 dB	±0.1 dB
10 dB	±0.3 dB
60 dB	±0.5 dB
80 dB	±2 dB

6.1.2 Return loss (RL)

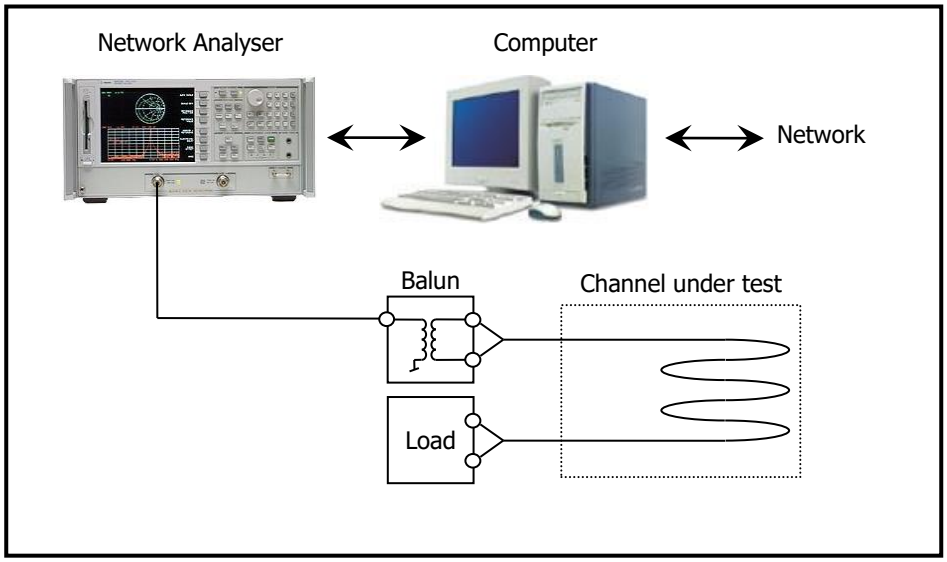

Figure 4. Test set-up for return loss measurements.

The return loss of the channel under test is measured with the far end terminated with a resistance of the specified characteristic impedance of the channel under test.

The measurement uncertainty for impedance is ±1.7 % at 100 MHz.
The measurement uncertainty for return loss is dependant of the measured return loss value. The error band is specified in the table below:

Measured return loss	Error band
5 dB	±0.2 dB
10 dB	±0.3 dB
15 dB	±0.5 dB
20 dB	±1 dB
25 dB	±2 dB
30 dB	±3 dB

At frequencies above 500 MHz add ±1 dB to the uncertainty.

6.1.3 Near end crosstalk (NEXT)

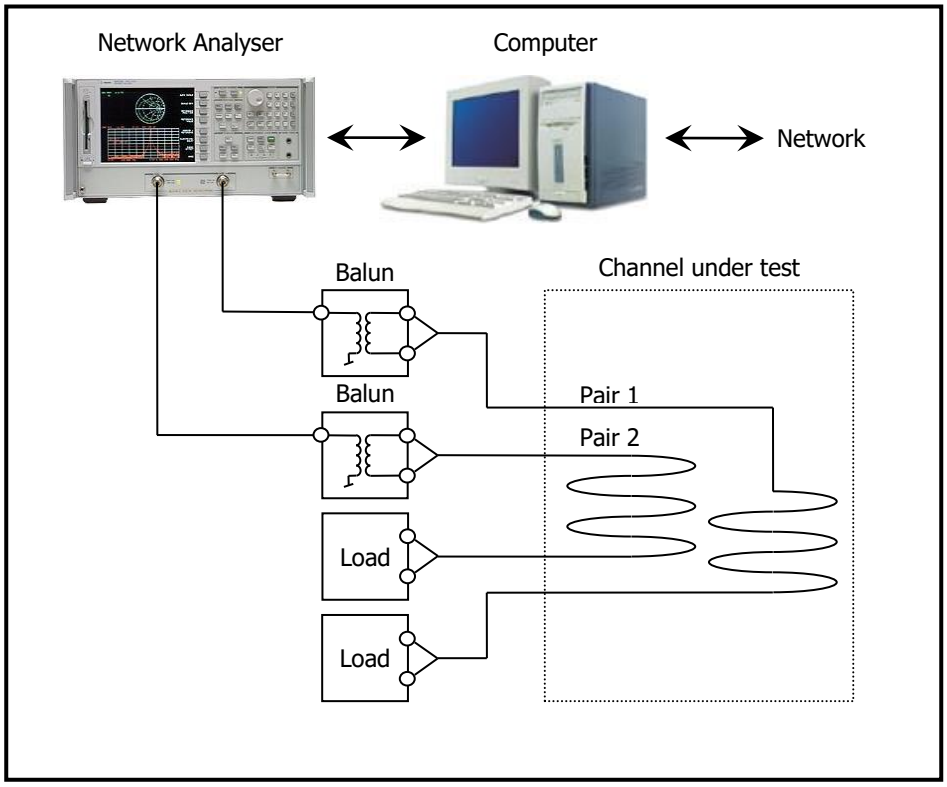

Figure 5. Test set-up for near end crosstalk measurements.

Near end crosstalk, NEXT, is measured as the attenuation from one pair to the others and these measurements are repeated for all pair combinations.

In the far end all pairs are terminated with a resistor with a value of the nominal characteristic impedance of the component under test.

The measurement uncertainty for NEXT is dependant of the level of measured NEXT.
The uncertainty is shown in the table below:

Measured NEXT	Uncertainty
40 dB	±0.5 dB
60 dB	±0.6 dB
70 dB	±0.8 dB
80 dB	±1.7 dB

6.1.4 Powersum near end crosstalk (PSNEXT)

PSNEXT is calculated for each pair according to the formula:

$$PSNEXT = -10\,log(10^{-x1/10} + 10^{-x2/10} + 10^{-x3/10})$$

where x1, x2, x3 are the pair-to-pair crosstalk measurements in dB between the selected pair and the other three pairs.

The measurement uncertainty is the same as for NEXT measurements.

6.1.5 Attenuation to crosstalk loss ratio (ACR-N)

Attenuation to crosstalk ratio loss near end, ACR-N is calculated for each pair as the difference between the near end crosstalk loss and the attenuation.

The measurement uncertainty is the same as for NEXT measurements.

6.1.6 Power sum ACR (PSACR-N)

PSACR-N is calculated according to the formula:

$$PSACR - N = -10log\,(10^{-x1/10} + 10^{-x2/10} + 10^{-x3/10})$$

where x1, x2 and x3 are the ACR-N values in dB between the selected pair and the other three pairs.

The measurement uncertainty is the same as for NEXT measurements.

6.1.7 Attenuation to crosstalk ratio-far end (ACR-F)

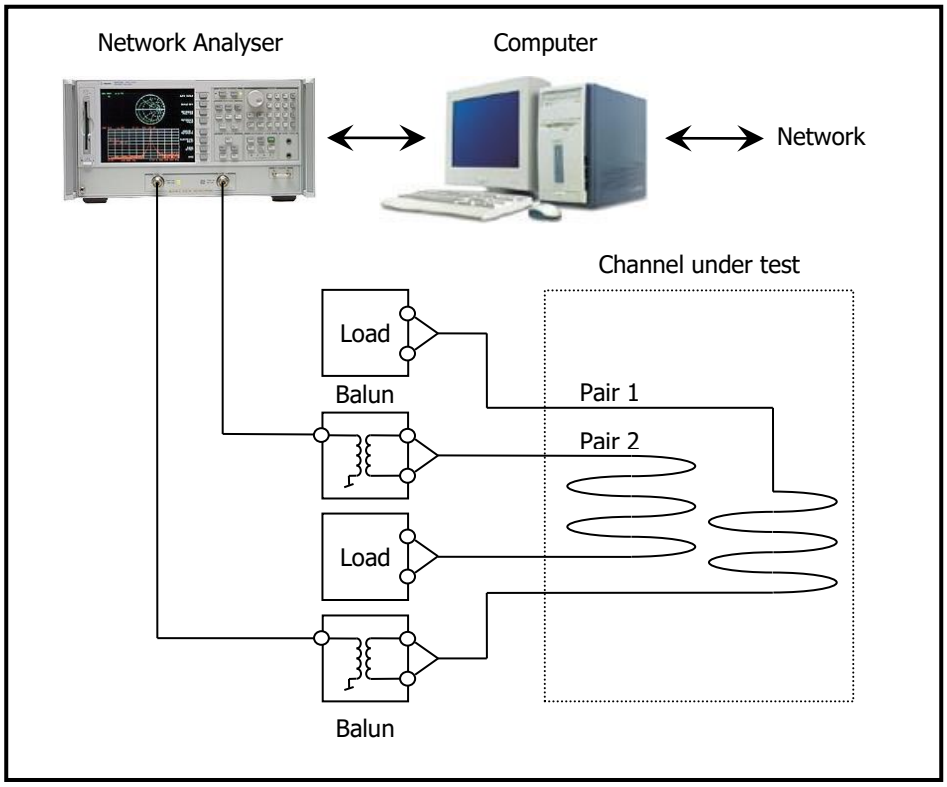

Figure 6. Test set-up for far end crosstalk measurements.

ACR-F is calculated from the measured values of far end cross talk, FEXT and attenuation, ATT.

ACR-F = FEXT - ATT

The measurement uncertainty for ACR-F is the sum of uncertainties for NEXT and ATT.

6.1.8 Power sum attenuation to crosstalk ratio far end (PSACR-F)

PSACR-F is calculated for each pair according to the equation:

$$PSACR - F = PSFEXT - ATTENUATIO\,N$$

$$PSFEXT = -10\,log(10^{-x1/10} + 10^{-x2/10} + 10^{-x3/10})$$

Where x1, x2, x3 are the pair-to-pair crosstalk measurements in dB between the selected pair and the other three pairs.

6.1.9 DC loop resistance

DC loop resistance is measured for each conductor in a pair. The loop resistance is calculated by adding the resistance of each conductor. The measured value is corrected for the temperature of the test object in order to obtain the resistance at 20 °C.

The measurement uncertainty for DC resistance is ±1.4 %.

6.1.10 Propagation delay

Propagation delay is measured by determining the phase delay of a signal transmitted through the cable.

$$\delta = \frac{\varphi}{2\pi \times f}$$

where φ is the phase delay, f is the frequency in Hertz.

The measurement uncertainty for delay is ±1 %.

6.1.11 Delay skew

Delay skew is calculated as the difference between the maximum and minimum propagation delay over the four pairs at each frequency.

The measurement uncertainty for skew is ±10 %.
